MDPs Abstract: Feature selection is an important challenge in machine learning.

Unfortunately, most methods for automating feature selection are designed for supervised learning tasks and are thus either inapplicable or impractical for reinforcement learning.

About feature selection. In machine learning and statistics, feature selection is the process of selecting a subset of relevant, useful features to use in building an analytical model.

Feature selection helps narrow the field of data to the most valuable inputs. Narrowing the field of data helps reduce noise and improve training performance.

a need to develop automatic feature selection techniques. In this paper we describe a greedy pro-cedure for automatically selecting features to use within the Markov random field model for information retrieval. We also propose a novel, robust method for describing classes of textual information retrieval features.
